GPS Tracker Communication Protocol

1. Summarize

This tracker connects to platform server with **TCP**. The way for connection is that device connects to the platform server forwardly. After connecting to the platform server, the tracker will feedback a enrolling message. The enrolling message contains the device's ID. If the device received the answer from the platform server, it will stop to sending enrolling message but send continuous feedback message. The continuous feedback message not contains the device ID. The platform server binds the device by connection. One connection represents a device ID. When the connection cuts off, the device will connect the platform server automatically and send out a device enrolling message. Beside, the device will send out one hand-shaking message intervals of time. The hand-shaking message contains Device ID. After receiving the handshaking answer message from the platform server, the device waits for sending the handshaking message in next period.

2.2 Message format

GPS Tracker exchanges the information with network gateway through data frames transmitting，using TCP protocol. Full data frames structure definition for GPRS is as following:

Head	Serial number / Time	Command	Message Body	Trail
1 byte	12 byte	4 byte	N byte (N≤1K)	1byte

Each Full data frame must contain: Head symbol, Serial Number/ Time, Command word, Message body, Trail symbol

2.3 Message field definition Y

2.3.1 Head/Trail symbol digit

Symbol digit figures the beginning and ending of the message frame. 0x28H (character "(") as beginning symbol，and 0x29H (character ")") as ending symbol.

2.3.2 Command word

Length：4 bytes，C_STRING character

Function: Define the type of operated message for data frame transmitting, and figures the function of data. The definition is as following,
